

Do you think that it is troublesome to modify the device memories, in existing screen program, with the change in connected PLCs?

We would like to introduce the way to change the device memories collectively in this issue.

- Device Conversion dialog
- When converting PLCs from Fuji Electric FLEX-PC/MICREX-F to MICREX-SX
- When changing the device memory range while no change in the model of PLCs

BEFORE

If the model of PLCs in the additional units is changed, the device memories in the screen program need to be changed by hand work.

Mitsubishi Electric PLC

Fuji Electric PLC

It requires time and effort to modify all device memories with the change in PLCs.

Using the Device Conversion dialog...

AFTER

It is possible to convert the device memories simultaneous with change of the model of PLCs by using the Device Conversion dialog.

Click [Yes] in the dialog which is displayed at the time of change of the model of PLCs.

Before Change ...	Before Change ...	After Change Start Device	Incre...
D00000	D65535	WM00000	1
W0000	WFFFF	WK00000	1
R0000	R65535	WB00000	1
TN0000	TN65535	WL00000	1
CN0000	CN65535	WF00000	1
SPU00000	SPU0FFFF	TS00000	1
M00000	M1048560	TR00000	1
L0000	L1048560	W900000	1
B00000	BFFFF0	CS00000	1
X00000	XFFFF0	CR00000	1
Y00000	YFFFF0	RD00000	1
TS00000		WS00000	1

It is possible to convert the device memories to the arbitrary memories by double-clicking the device memories you want to change!

Example

It is OK to do nothing other than deciding the range of the device memories based on the prepared comparison table!

You can speed up screen configuration by reusing the existing program!

For more useful information, please read the next page!

When converting PLCs from Fuji Electric FLEX-PC/MICREX-F to MICREX-SX

It is possible to convert device memories easily by using information of the PLC after the project of the PLC have been converted!

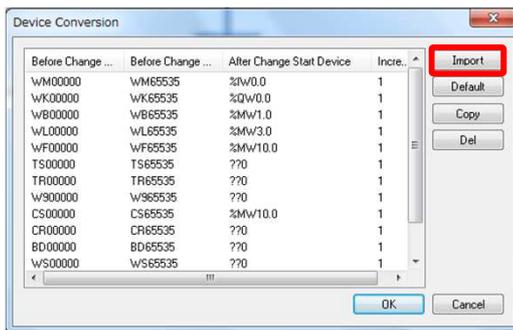

1. Convert the project on SX-Programmer Standard.

2. Export "Address Assignment" information on SX-Programmer Standard.

- FLEX-PC: *.nad
- MICREX-F: *.fad

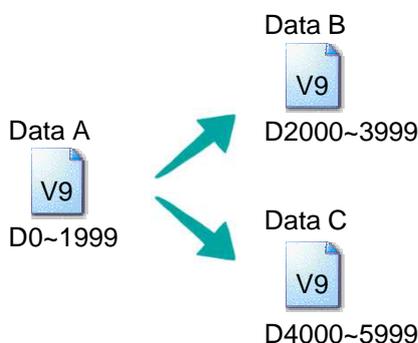

3. All you need to do on V-SFT is to import the file from Step 2 on the Device Conversion dialog at the time of changing [Connection Device]!

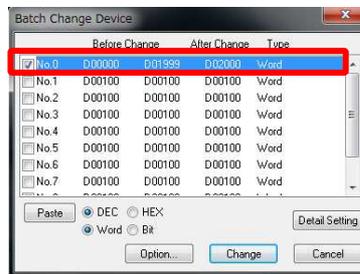

Work becomes smooth by using the Device Conversion dialog!

When changing the device memory range while no change in the model of PLCs

It is possible to change the device memories in the whole screen program or specified range in a lump .

[Tool] > [Device/Change Memory]

All you need to do is specify the range of the device memory before and after change!
